

Notes on DailyScores

In this file, I try to utilize the PullData function.

Here, the function pulls updated data and displays the scores of the previous NBA-day using matplotlib.

The point here, is not to impress by displaying the scores, but to demonstrate how the PullData successfully gives updated information upon request. Information which may be used for simple tasks, like displaying scores, or much more advanced processes like machine learning.

The important part is being able to do such things continually.

Note that this small project has also given me new experiences using matblotlib, and pulling images from a directory and displaying them.
